Abstract:

This report presents the implementation of a complete motion planning and execution pipeline for a 6-degree-of-freedom (6-DOF) robotic manipulator using MoveIt 2 within the ROS 2 framework. The objective is to simulate and control the robot's motion by integrating key components such as URDF-based robot modeling, trajectory planning, and visualization through RViz and Gazebo. A customized configuration package is generated using the MoveIt Setup Assistant and adapted to ensure seamless operation across the simulation and planning environments. To validate the system, the robot is tasked with reaching a series of goal positions derived from the team members' student ID digits, introducing project-specific variations. Final outputs include a working simulation, visual documentation, a detailed report, and a demonstration video highlighting the robot’s ability to perform accurate and reliable trajectory execution.

1.0 Introduction

The primary objective of this project is to showcase the implementation of motion planning and execution for a six-degree-of-freedom (6-DOF) robotic manipulator using the MoveIt 2 motion planning framework within the Robot Operating System 2 (ROS 2) ecosystem. This milestone extends core concepts in robotic simulation and control by constructing a complete and functional motion planning pipeline. The pipeline encompasses essential components such as robot modeling, trajectory generation, planning algorithm integration, and real-time visualization.

To initiate the setup, the MoveIt Setup Assistant is utilized to create a configuration package specifically adapted to the robot's Unified Robot Description Format (URDF) model. This package includes necessary launch files, planning configurations, and controllers. Subsequent customization and verification ensure seamless compatibility with both RViz—used for visualizing motion plans and joint configurations—and Gazebo, which provides realistic, physics-based simulation of the robot's dynamics and environment interactions.

For performance evaluation, the robotic manipulator is programmed to move to a set of predefined target poses. These target positions are uniquely derived from the last two digits of each team member's student ID, adding a layer of uniqueness and individualization to each team's implementation. This also tests the robot's ability to handle arbitrary goal states while maintaining accurate inverse kinematics and trajectory planning.

2.0CAD Model Import & URDF Conversion

Figure 1:CAD Model

To integrate the robotic arm with ROS2, we exported the SolidWorks assembly as a URDF file using the SolidWorks URDF Exporter Plugin. During the export process, each link and joint was carefully named and assigned realistic mass and inertia values.

```xml

4.0 Creating the Launch File

```python
from launch import LaunchDescription
from launch.actions import (
    DeclareLaunchArgument,
    IncludeLaunchDescription,
    SetEnvironmentVariable,
)
from launch.substitutions import PathJoinSubstitution
from launch_ros.actions import Node
from launch.launch_description_sources import PythonLaunchDescriptionSource
from ament_index_python.packages import get_package_share_directory
import xacro
import os

def generate_launch_description():
    pkg_ros_gz_sim = get_package_share_directory("ros_gz_sim")
    pkg_lab_gazebo = get_package_share_directory("abb_robot")

    # Process the Xacro file to generate URDF
    xacro_file = os.path.join(pkg_lab_gazebo, "urdf", "robot_pkg.urdf")
    doc = xacro.parse(open(xacro_file))
    robot_description = doc.toxml()

    gazebo = IncludeLaunchDescription(
        PythonLaunchDescriptionSource(
            os.path.join(pkg_ros_gz_sim, "launch", "gz_sim.launch.py")
        ),
        launch_arguments={"gz_args": "-r empty.sdf"}.items(),
    )

    # Robot State Publisher node
    robot_state_publisher_node = Node(
        package="robot_state_publisher",
        executable="robot_state_publisher",
        parameters=[{"robot_description": robot_description}],
        output="screen",
    )

    # Joint State Publisher node
    joint_state_publisher_node = Node(
        package="joint_state_publisher",
        executable="joint_state_publisher",
        name="joint_state_publisher",
        output="screen",
    )

    # Add the bridge node for mapping the topics between ROS and GZ sim
```

Figure 5:Launch file 1

```python
        package="ros_gz_bridge",
        executable="parameter_bridge",
        arguments=[
            # Clock (IGN -> ROS2)
            "/clock@rosgraph_msgs/msg/Clock[gz.msgs.Clock",
            # Joint states (IGN -> ROS2)
            "/world/empty/model/abb_robot/joint_state@sensor_msgs/msg/JointState[gz.msgs.JointState",
        ],
        remappings=[
            ("/world/empty/model/abb_robot/joint_state", "joint_states"),
        ],
        output="screen",
    )

    # Spawn Entity node
    spawn_entity = Node(
        package="ros_gz_sim",
        executable="create",
        arguments=["-name", "abb_robot", "-topic", "/robot_description"],
        parameters=[{"use_sim_time": True}],
        output="screen",
    )

5.0. MOVEIT SETUP ASSISTANT

5.1 Collison Matrix

In this step, a collision matrix was configured to define the self-collision behavior between individual robot links.

Figure 9:Collison Matrix

5.2 Planning Groups

Next, two planning groups were defined: one for the robotic arm, encompassing joints 1 through 6, and another for the hand (gripper), which includes joints 7 and 8.

Figure 10:Planning Groups

5.3 Robot Poses

In this section, five distinct poses were configured for the robot—three assigned to the arm group and two to the hand (gripper) group.

- Pose 0: This pose is defined as the initial position of the robot, so all joints are zero degrees (0 rad).

Figure 11:Zero Pose

<u>Pose 1</u>: In this pose the joints are defined with student id 21P0240

- **Joint 1**: $0 \times 10 = \mathbf{0°}$
- **Joint 2**: $4 \times 10 = \mathbf{40°}$
- **Joint 3**: $0 \times 5 = \mathbf{0°}$
- **Joint 4**: $4 \times 5 = \mathbf{20°}$
- **Joint 5**: $(0 + 2) \times 10 = \mathbf{20°}$
- **Joint 6**: $\mathbf{0°}$

Figure 12:Pos 1

<u>Pose 2</u>: In this pose the joints are defined with student id 21P0041

- **joint 1**: $4 \times 10 =$ **40°**
- **Joint 2**: $1 \times 15 =$ **15°**
- **Joint 3**: $4 \times$ -5 = **-20°**
- **Joint 4**: $1 \times 5 =$ **5°**
- **Joint 5**: $(1 + 1) \times 10 =$ **20°**
- **Joint 6**: **0°**

Figure 15: Gripper Fully opened

5.4 ROS2 Controllers

In this step, we configured two ROS 2 controllers—one dedicated to the arm group and the other to the hand (gripper) group.

Figure 16:ROS2 Controllers

5.5 Moveit Controllers

Two MoveIt controllers were set up, each corresponding to one of the planning groups.

Figure 17:5 Moveit Controllers
